

Configuring V-Net and Deploying a Virtual Machine on it

This demo will help you to create a virtual network and add a virtual machine on it by configuring the availability sets, network security group and virtual network.

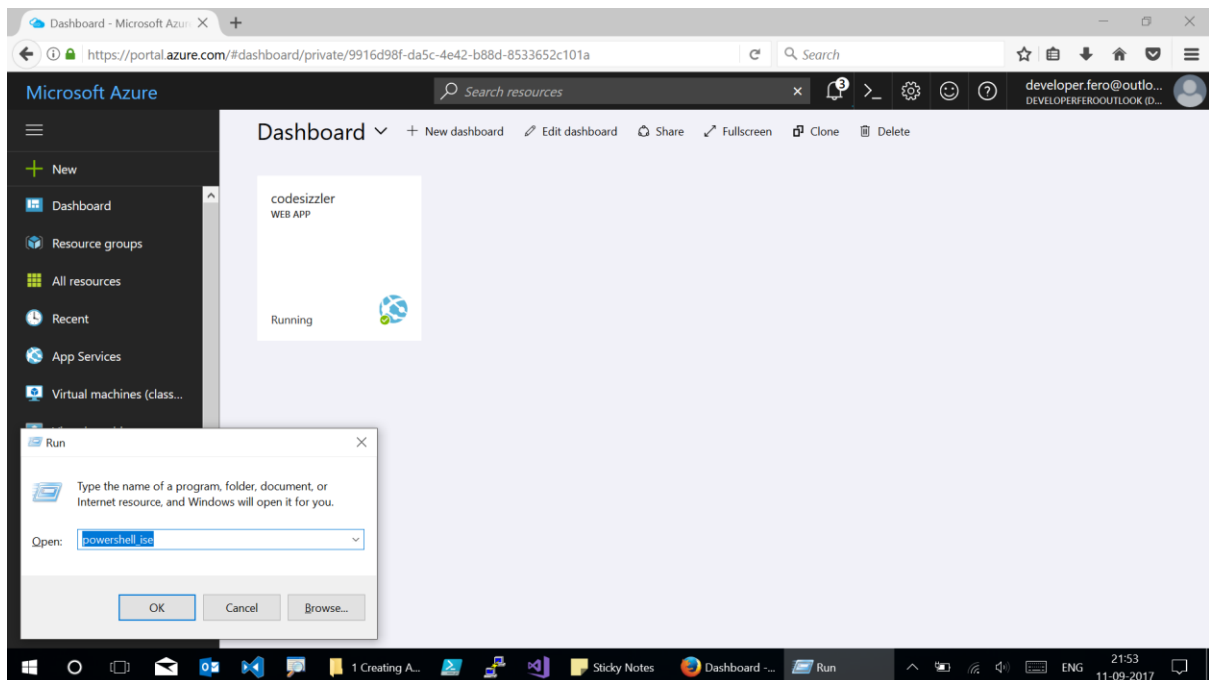

Pre-requisites:

- Azure Subscription.
- Powershell ISE installed on the machine.

Follow the below steps now:

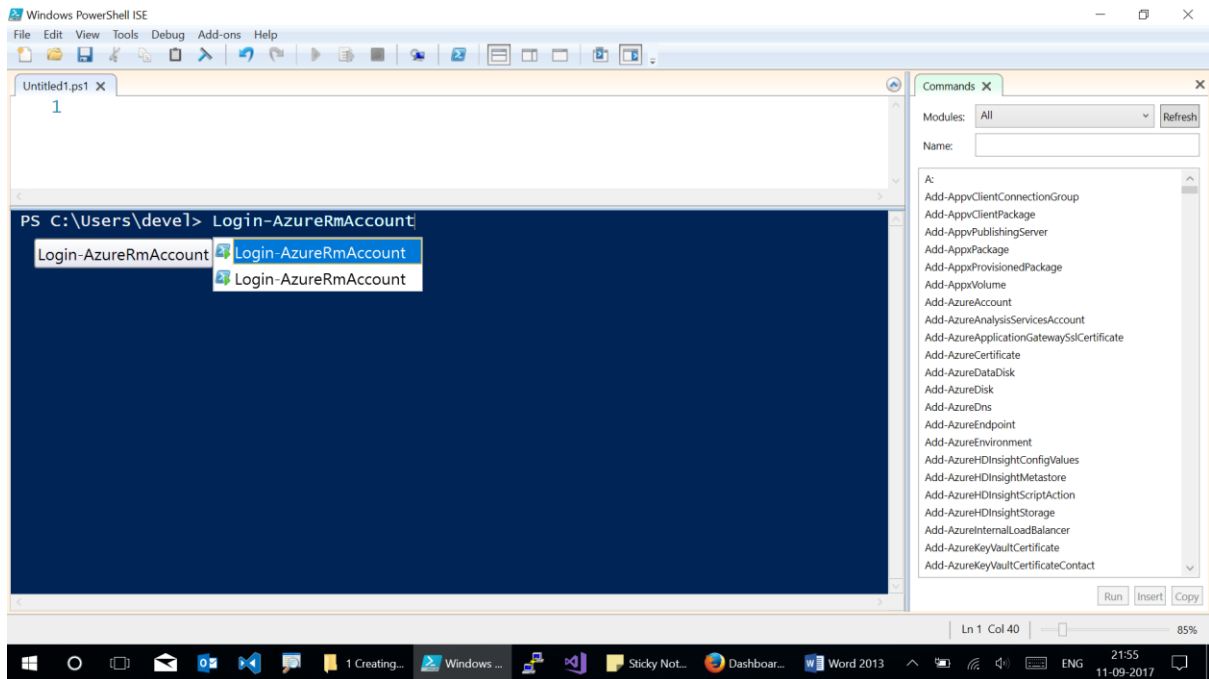

Step 01:

Go for powershell as admin by Run → powershell_ise

Enter the below command to login for the azure account at powershell.

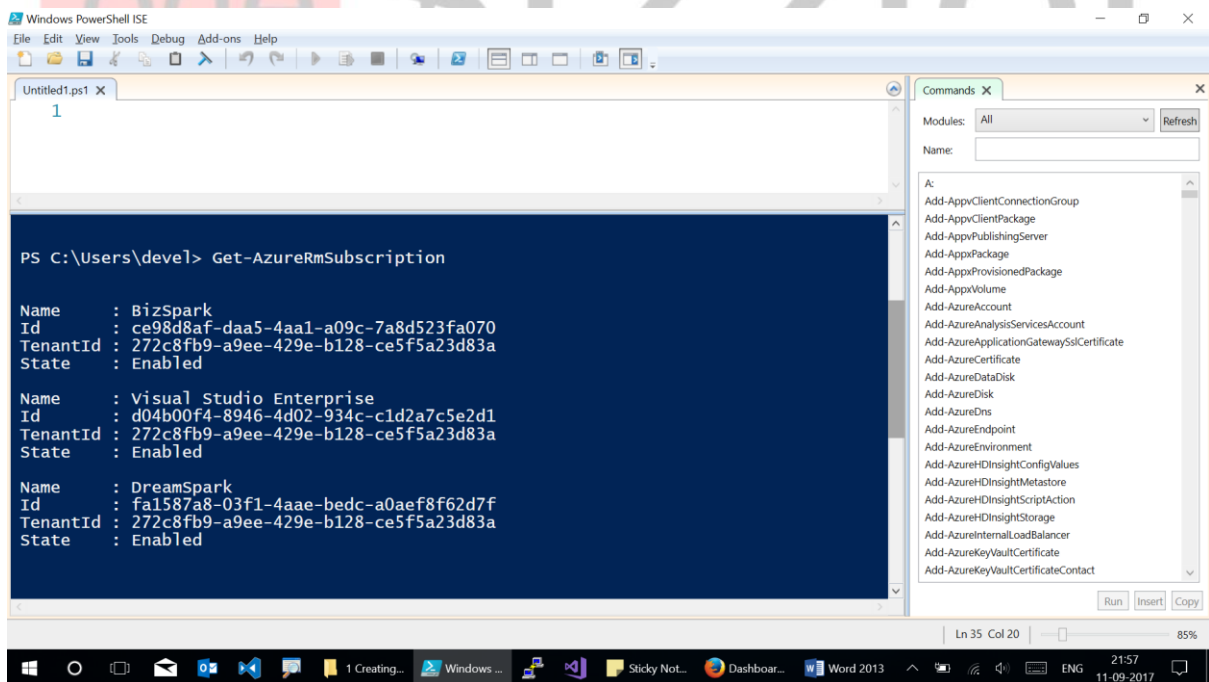

```
Login-AzureRmAccount
```

Use the below command to list out the subscription on azure.

Get-AzureRmSubscription

Here goes the subscriptions listed out.

The below command will help to select a particular subscription to deploy or to use the subscription for the resource which is to be created.

Select-AzureRmSubscription -SubscriptionName "Bizspark"

```
Windows PowerShell ISE
File Edit View Tools Debug Add-ons Help
Untitled1.ps1 X
1
Name : DreamSpark
Id : fa1587a8-03f1-4aae-bedc-a0aef8f62d7f
TenantId : 272c8fb9-a9ee-429e-b128-ce5f5a23d83a
State : Enabled

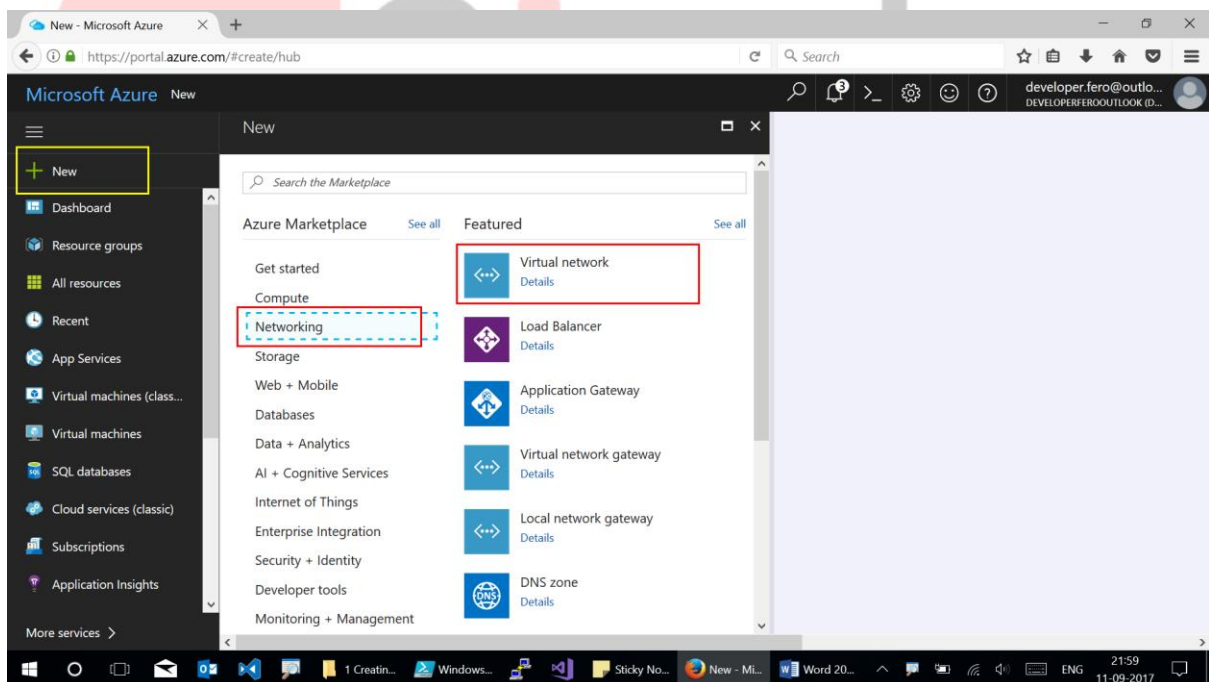

PS C:\Users\devel> Select-AzureRmSubscription -SubscriptionName "Bizspark"

Environment : AzureCloud
Account : developer.fero@outlook.com
TenantId : 272c8fb9-a9ee-429e-b128-ce5f5a23d83a
SubscriptionId : ce98d8af-daa5-4aa1-a09c-7a8d523fa070
SubscriptionName : BizSpark
CurrentStorageAccount :

PS C:\Users\devel>
```

Step – 02:

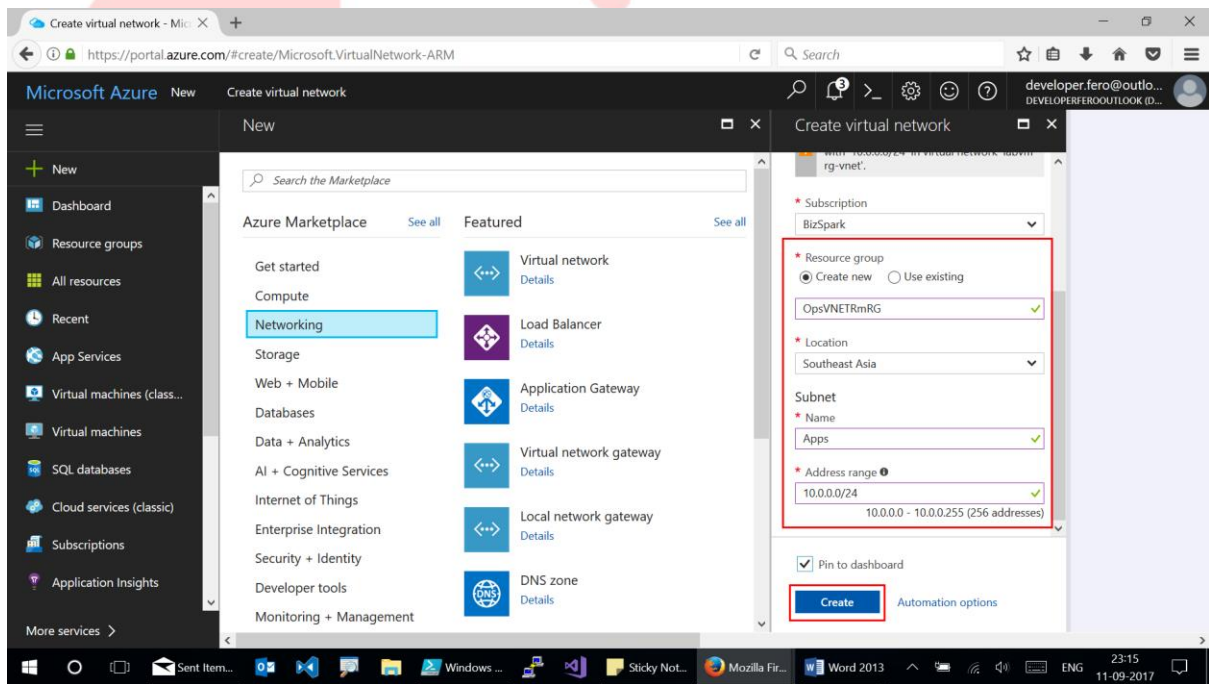

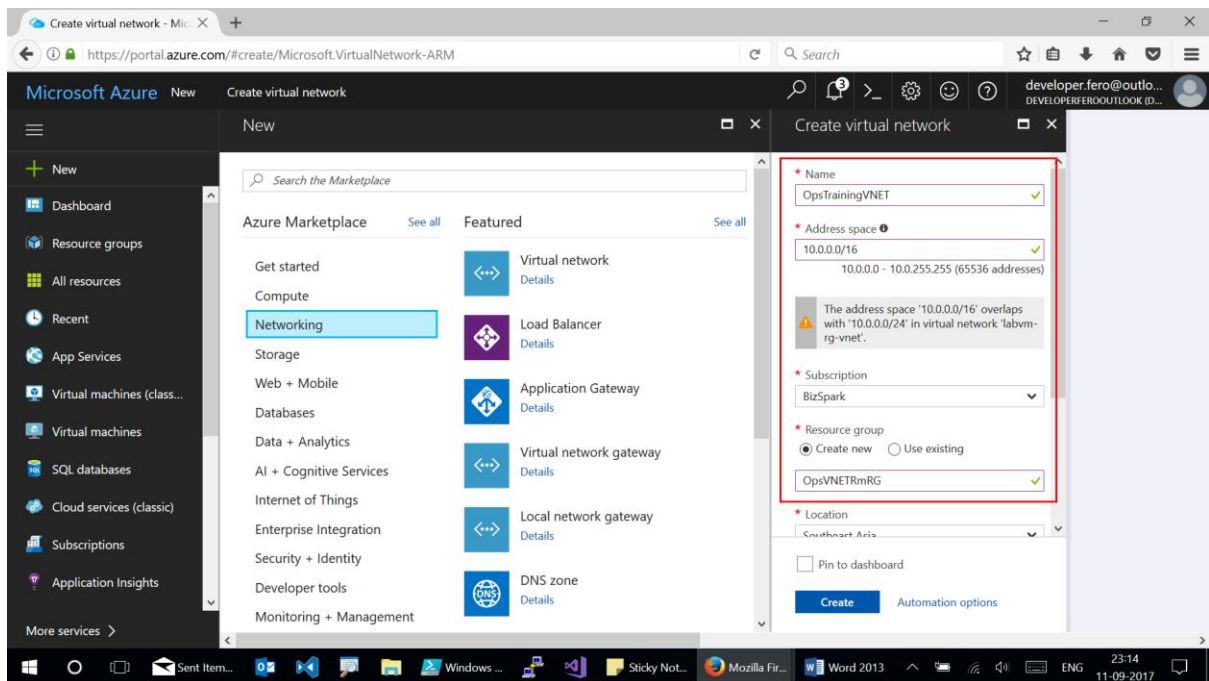

Login for the azure portal and go for New → Networking → Virtual Network

Configure the v-net with below details:

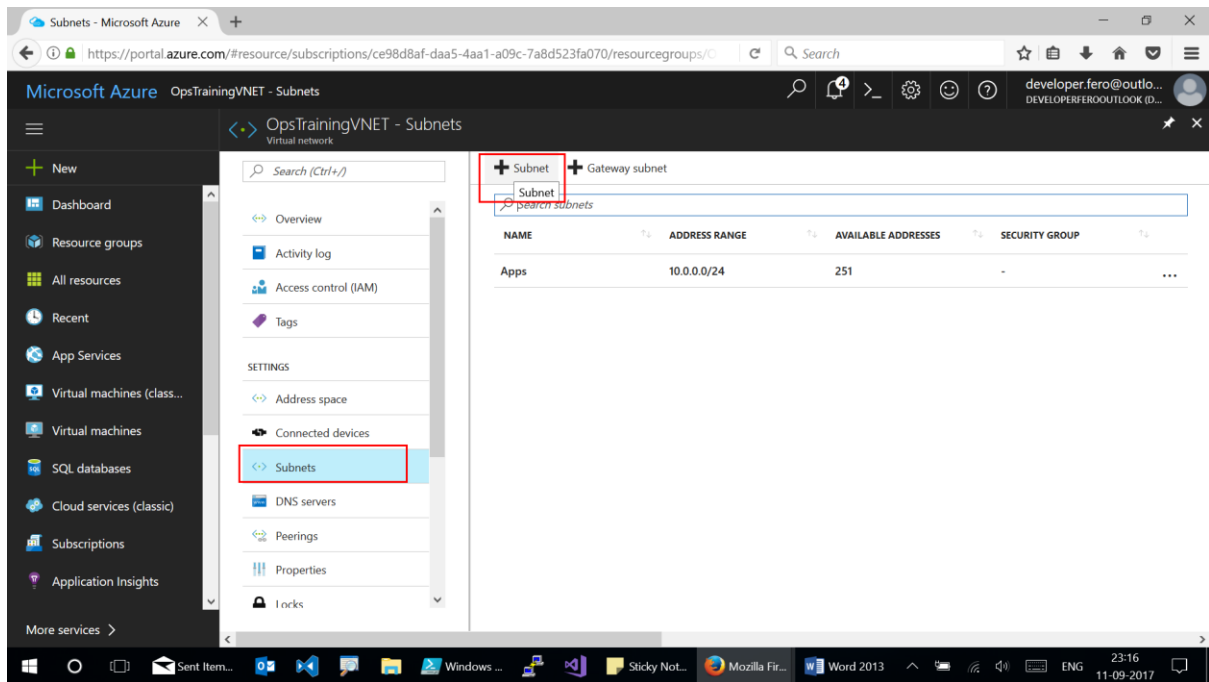

- V-net name – OpsTrainingVNET
- Address space – 10.0.0.0/16
- Subscription
- Resource Group – new one (OpsVNETRmRG)
- Location – Southeast Asia
- Subnet name – Apps
- Address range – 10.0.0.0/24

Click on “create”.

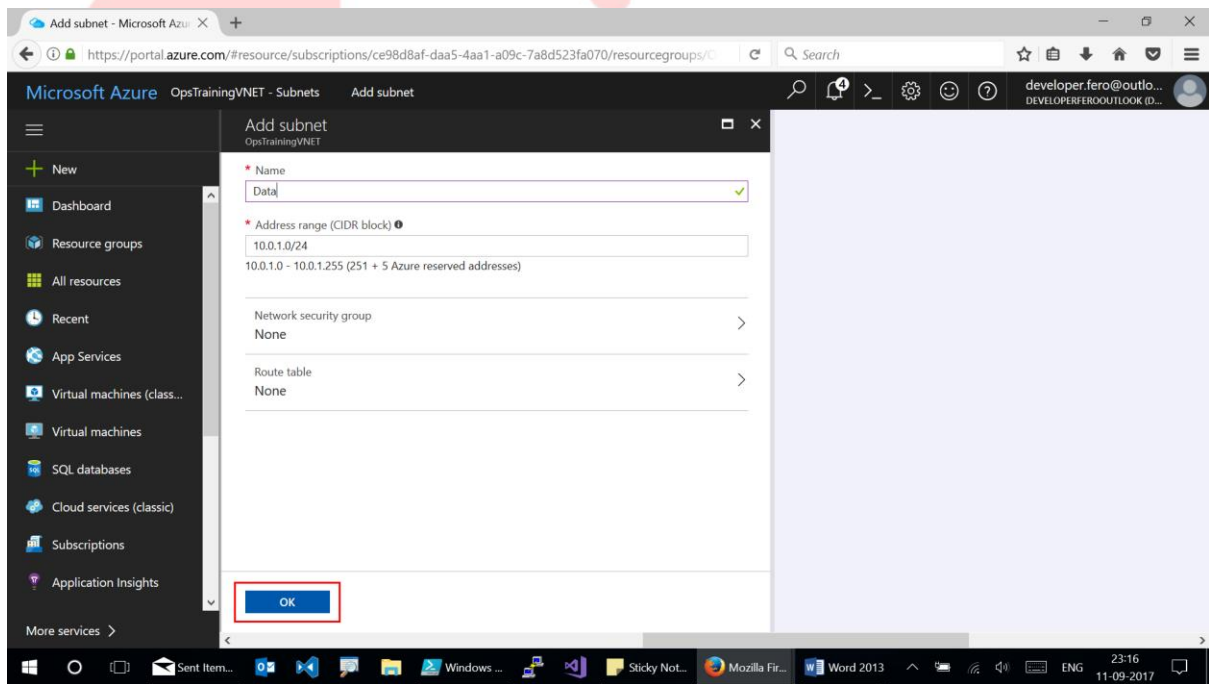

Add subnet on the v-net by clicking on “+Subnet”

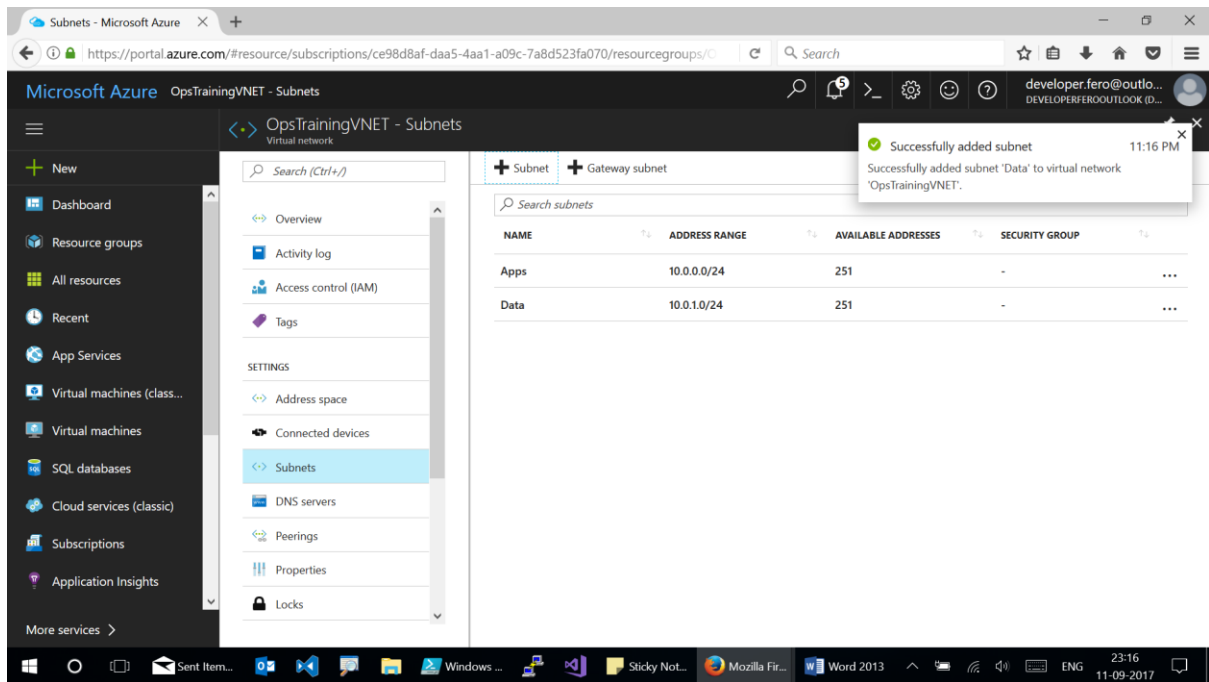

- Name – Data
- Address space – 10.0.0.0/24

Click on the “OK” button to add it.

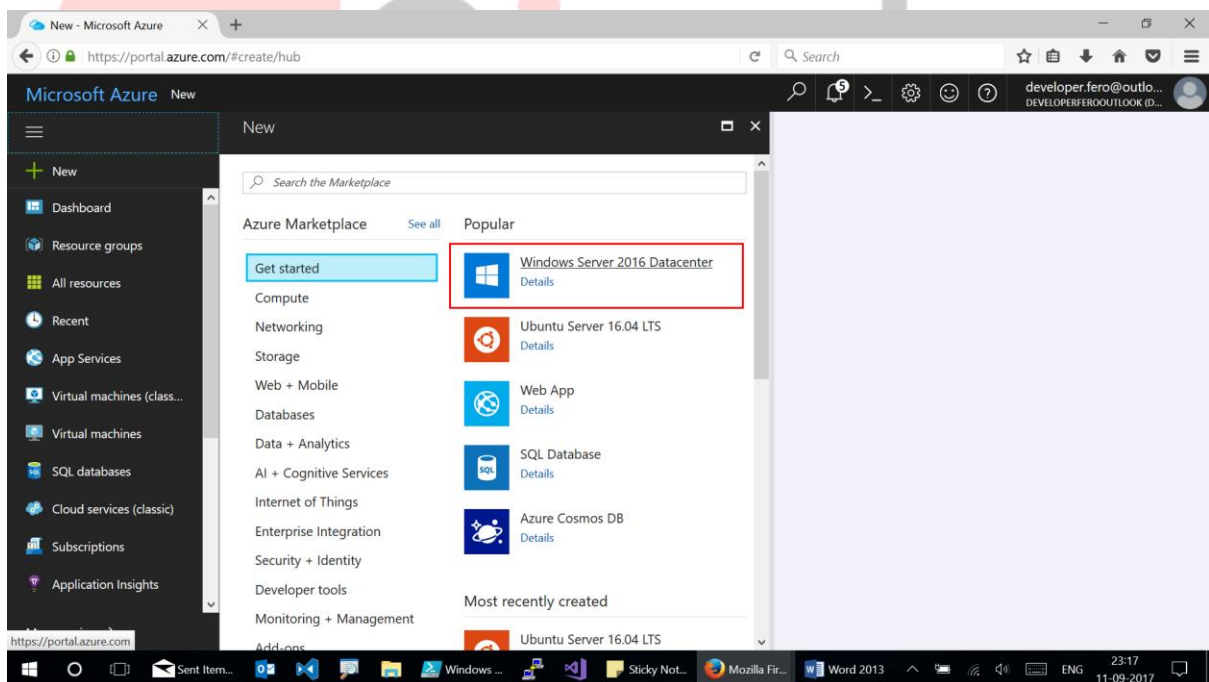

Here goes the subnet added at the v-net.

Step – 03:

For creating a virtual machine go for New → Compute → Windows Server 2016 Datacenter

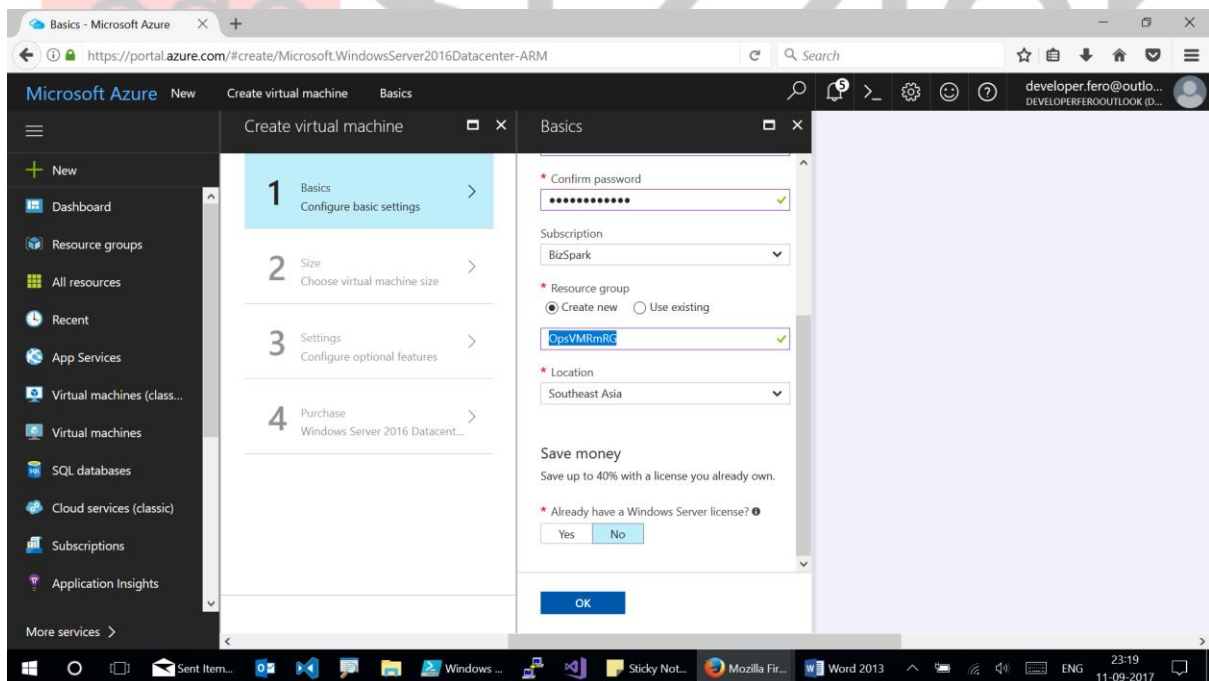

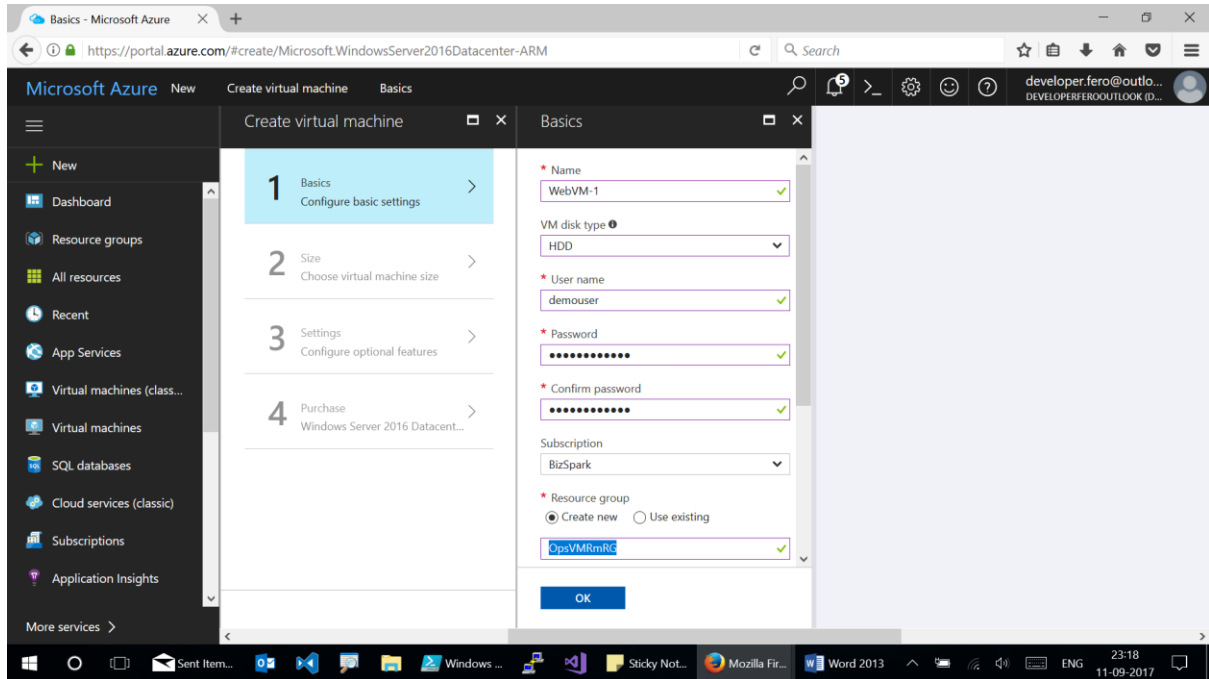

Fill the below blades of basics, size, settings and purchase.

Basics –

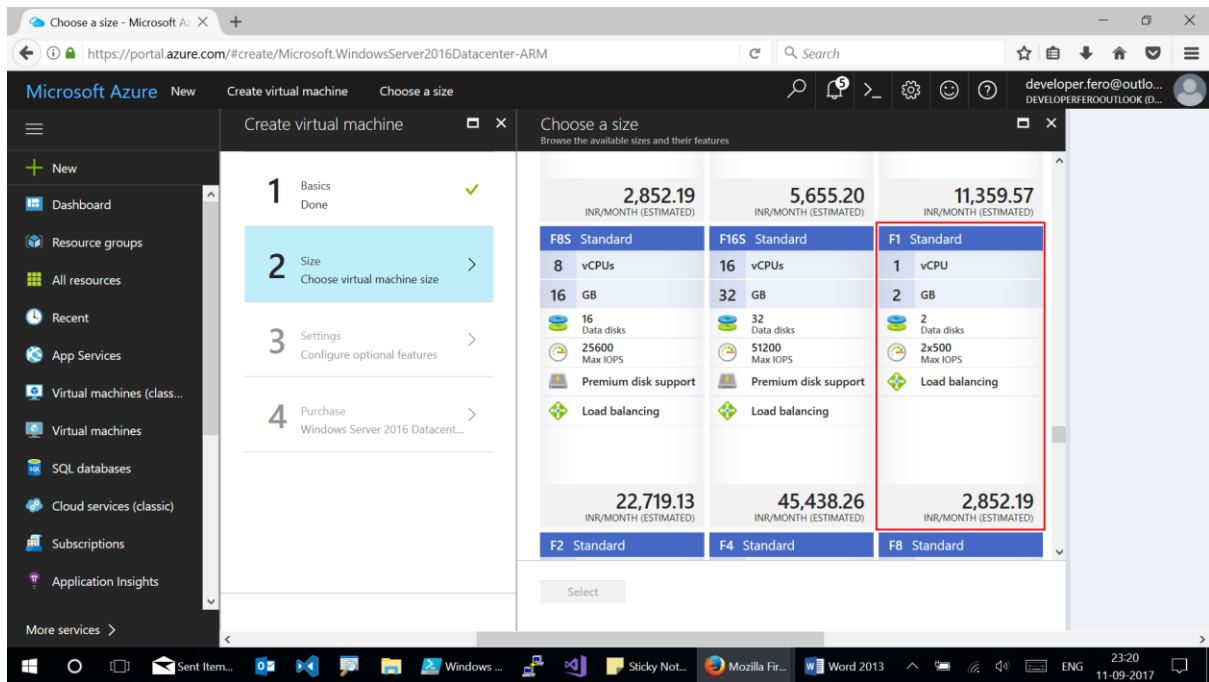

- Name – WebVM-1
- VM disk type – HDD
- User name – demouser
- Password – demo@pass123
- Confirm password – demo@pass123

- Subscription
- Resource group – create new (OpsVMRmRG)
- Location – Southeast asia

Click on “OK”

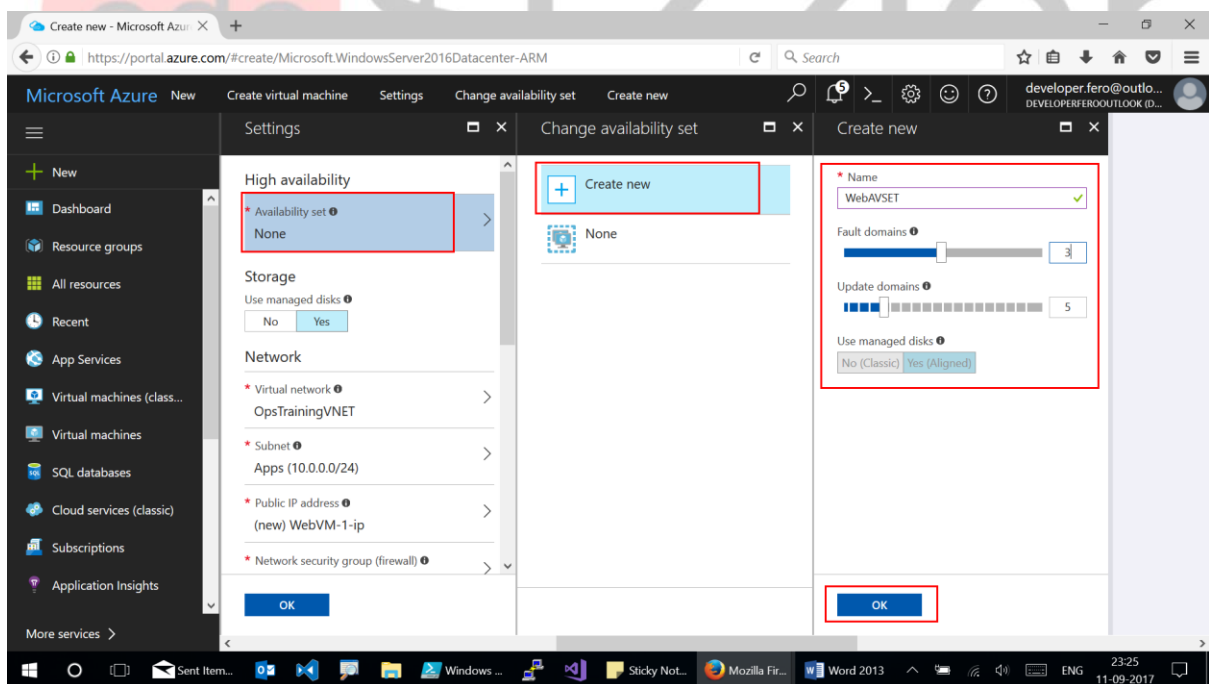

Size – F1 Standard

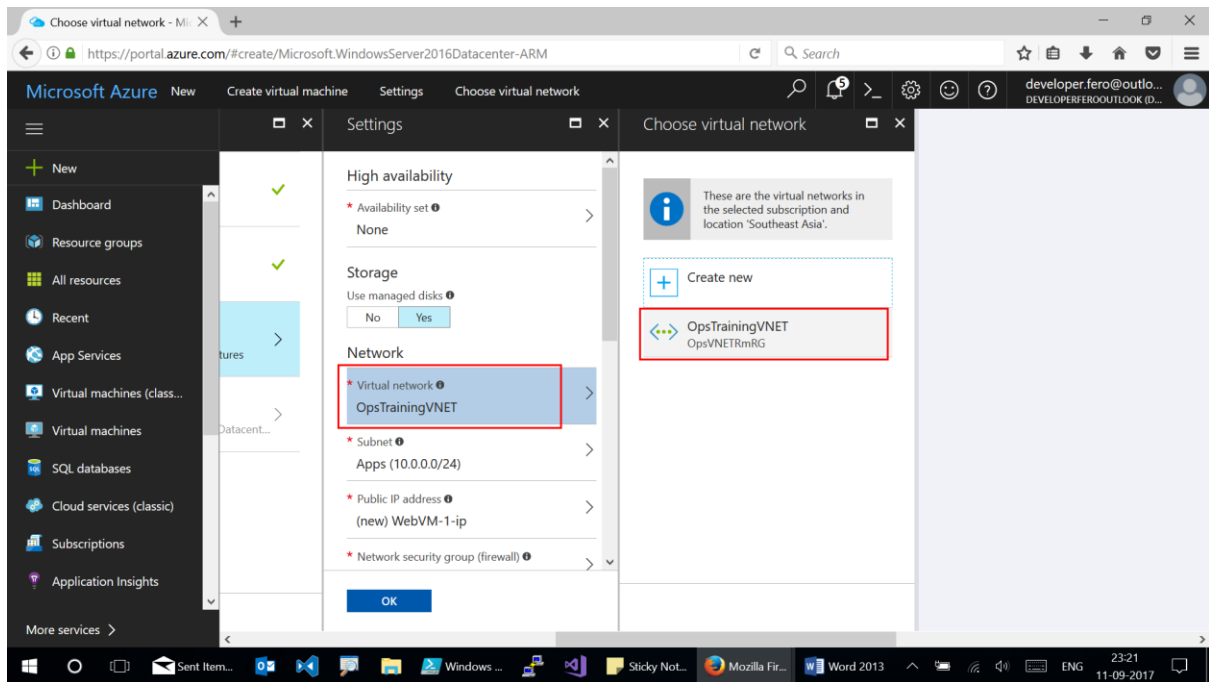

Settings –

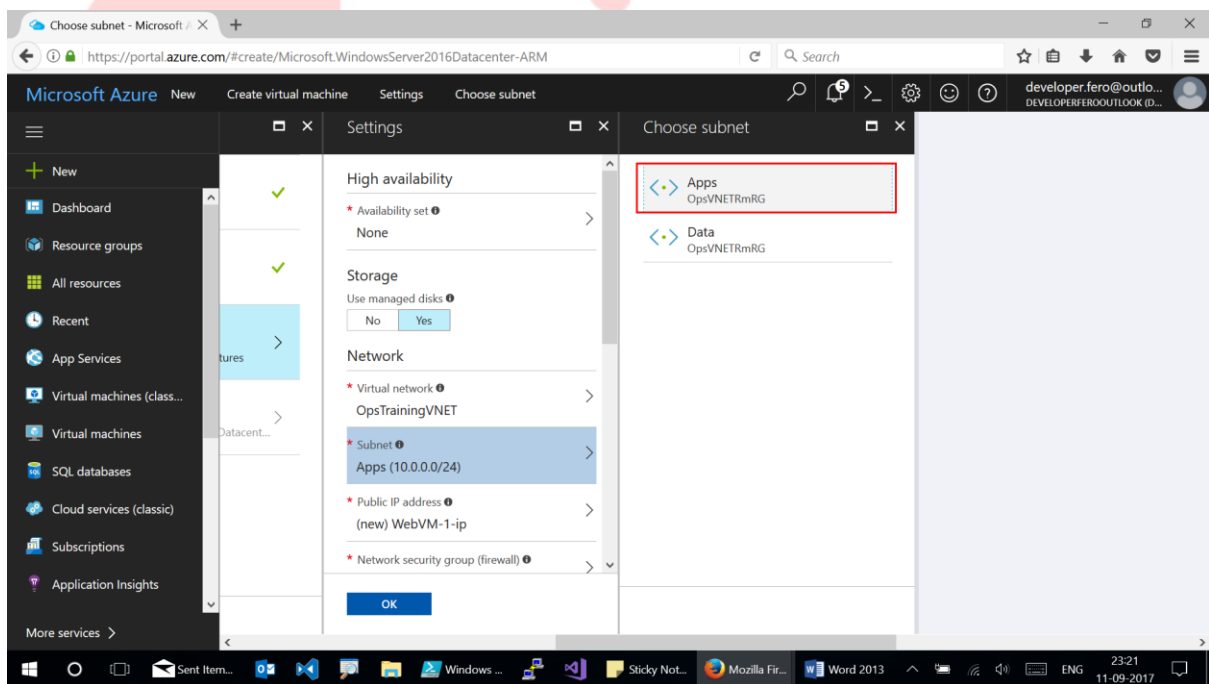

- Availability Set -
Create new → Name (WebAVSET) | Fault Domains – 3 | Update Domains – 5

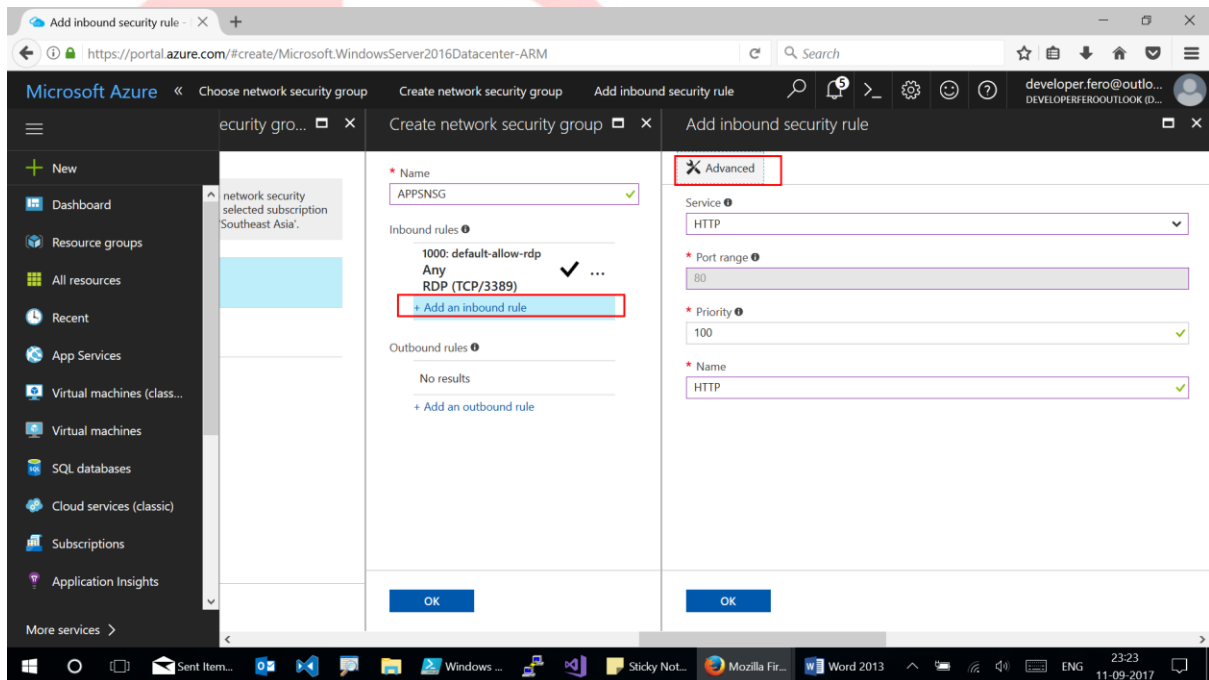

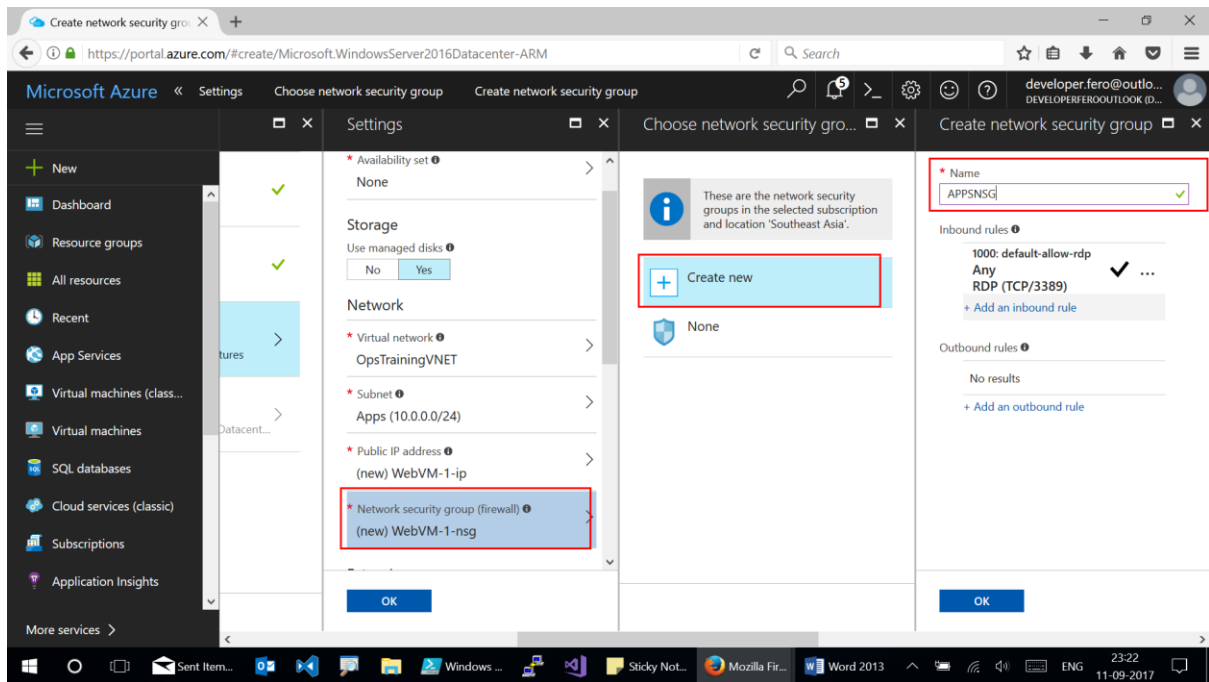

- Virtual Network – Select the v-net created before.

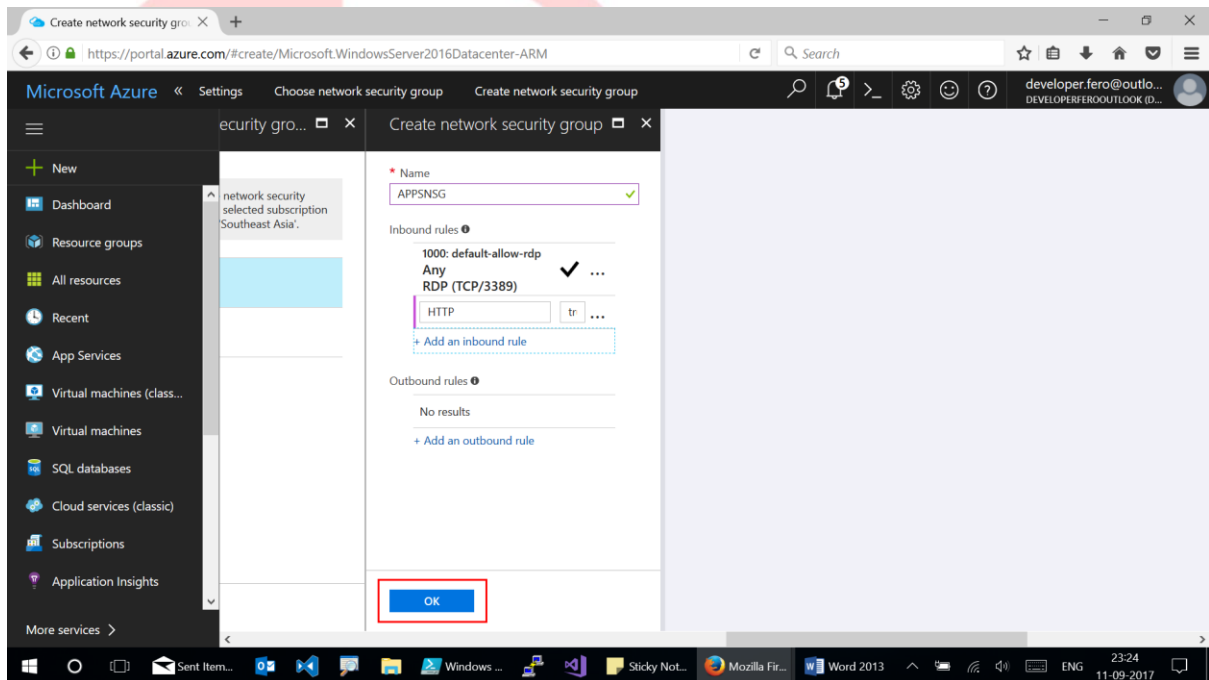

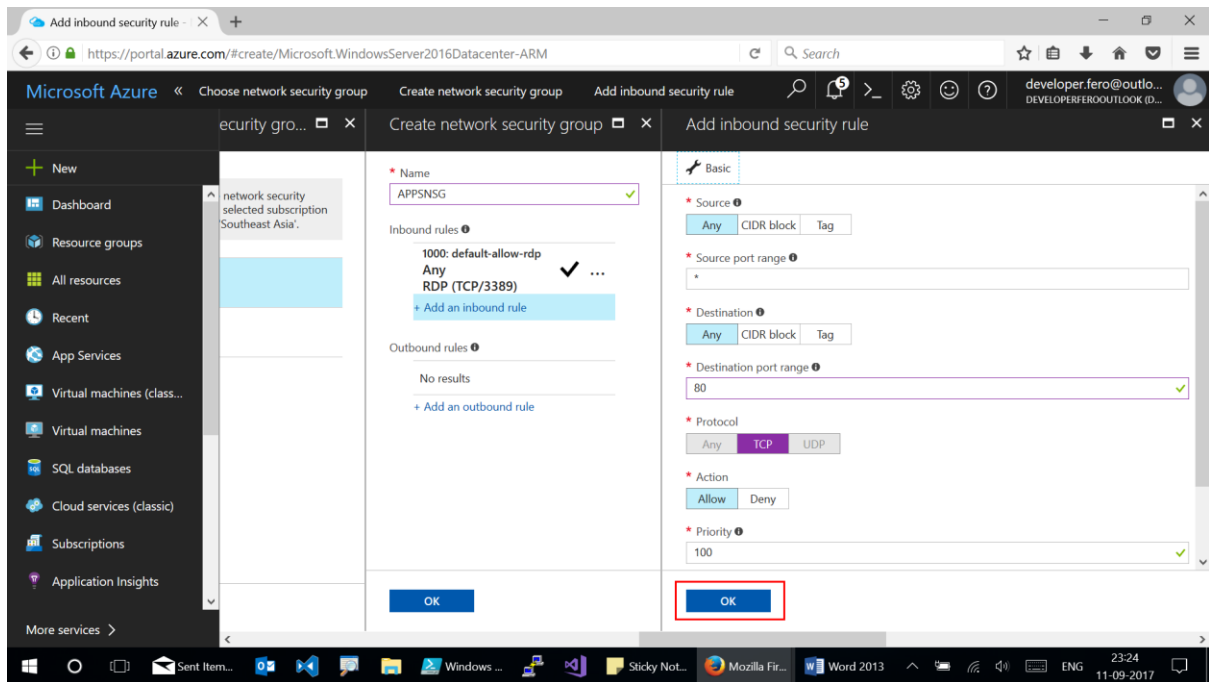

- Subnet – Select Apps as subnet if it is not selected by default.

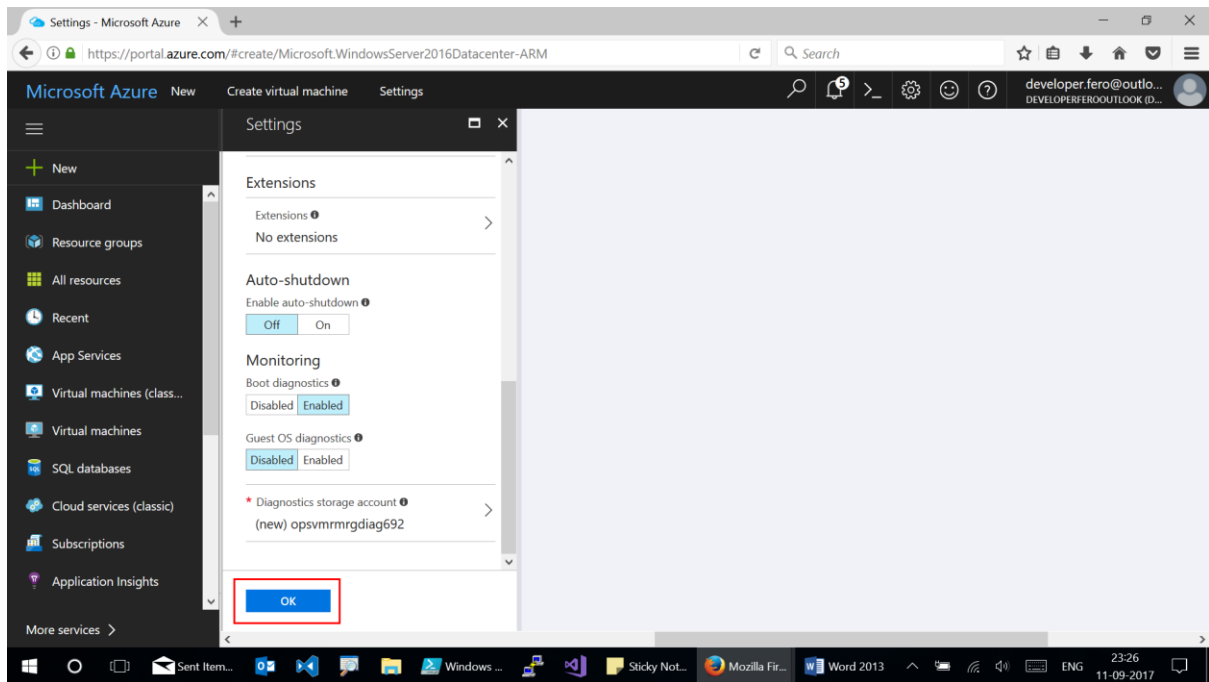

- Network Security Group (NSG) – Create new → name (APPSNSG)
Add an inbound rule - Advanced
→ Name – HTTP
→ Priority – 100
→ Source – Any
→ Service – HTTP
→ Protocol – fixed
→ Port range – fixed
→ Action - allow

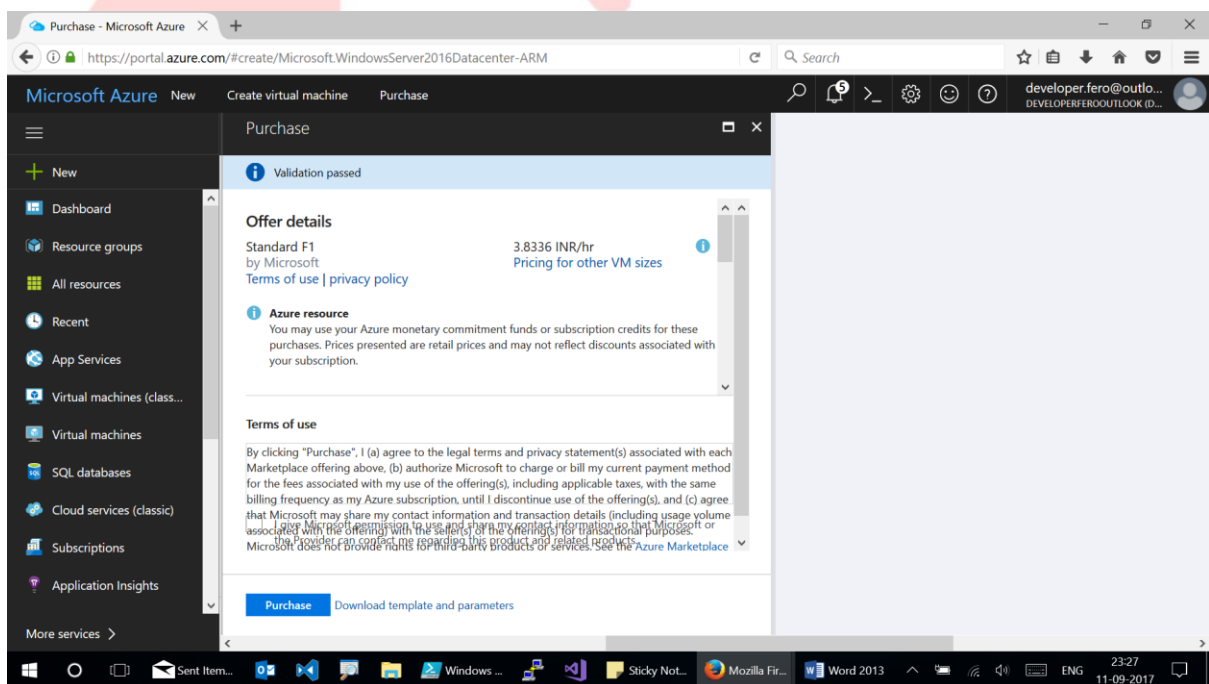

Click on OK to create it.

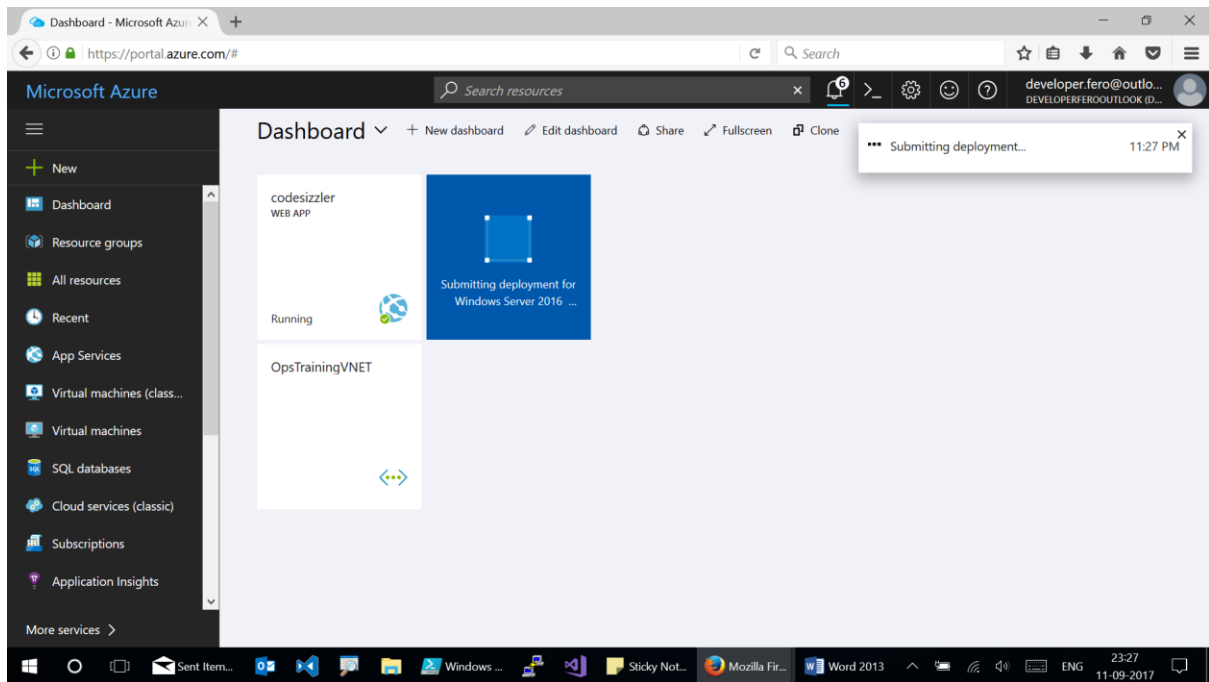

Click on "OK" to pass for the next blade.

Click on “Purchase” to create the Virtual Machine.

Here goes the VM getting deployed.
